IQ DOGSPORT / TECHNICAL WORK LOG

DHL Parcel DE — Automation Documentation

Revised 14 October 2026 | Three active automations | German and international shipping & returns

Current verified Staging setup

The initially separate domestic and international sales-order automations were consolidated. A dedicated transfer sync and a German return Receiver-ID automation remain separate. All three are reported working in Odoo Staging following fresh German and international order-and-return tests.

CURRENT STATUS	RECORD / PURPOSE	STATE
ACTIVE 1	Combined DHL Shipping Method — sale.order	Active; final ID not provided
ACTIVE 2	ID 66 — Sync DHL Carrier to Delivery — stock.picking	Active; passed latest tests
ACTIVE 3	ID 64 — DHL Automatic Return Receiver — stock.picking	Active; DE default = deu
UI VIEW	ID 6113 — Conditional receiver buttons	Active; not an automation
ARCHIVED	IDs 8 + 65 (old split assignment), ID 7 (fixed carrier)	Archived; retain for rollback

Why we changed the original setup

- One DHL shipping product could not serve both Germany (V01PAK) and international destinations (V53WPAK).
- The old transfer automation forced a fixed carrier; international shipments sometimes inherited GLS or domestic DHL instead of the sales-order carrier.
- German returns initially needed manual receiver lookup; they now default to deu without preventing a manual override.

Expected workflow

New Sales Order → combined default chooses German/international DHL if no delivery method is set → Outgoing Transfer inherits the selected carrier (Automation 66) → sandbox DHL label. Return → German receiver deu automatically or manually select a valid international receiver → return label.

Scope: Staging configuration and test results. This documentation repository is for reference only; it does not deploy changes to Odoo Production.

1. Combined Sales Order shipping automation

The new combined rule replaces the old Automation 8 (Germany) and Automation 65 (international). It runs on sale.order and selects the appropriate carrier when the Delivery Method is initially empty.

SETTING	CURRENT INTENDED BEHAVIOR
Model / Trigger	Sales Order (sale.order) / On create
Apply on	Delivery Method is not set; Delivery Address country is present
Country = DE	Use DHL Parcel DE (domestic), shipping product V01PAK
Country != DE	Use DHL Parcel DE – International, shipping product V53WPAK
Existing carrier	Do not replace a preselected carrier (e.g. GLS)
New automation ID	Not shown in the supplied screenshots; record in GitHub after confirming in Staging

Reference Python logic — NOT a verified export

The following is the reference implementation discussed while consolidating the rules. The exact code currently saved in Odoo must be exported and treated as the authoritative source. Do not paste to Production without reviewing the destination whitelist and Shopify carrier mapping.

```
orders = records or record or env['sale.order']
for order in orders:
    if order.carrier_id:
        continue
    country = order.partner_shipping_id.country_id
    if not country:
        continue
    carrier_name = ('DHL Parcel DE' if country.code == 'DE'
                    else 'DHL Parcel DE – International')
    carriers = env['delivery.carrier'].search([
        ('name', '=', carrier_name),
        ('delivery_type', '=', 'dhl_parcel_de')
    ])
    if len(carriers) != 1:
        log('Carrier not unique: %s' % carrier_name, level='warning')
        continue
    order.write({'carrier_id': carriers.id})
```

Limitation: “Every non-DE country” is only a Staging test condition, not an approval to ship worldwide. Imported Shopify orders must honor the shipping service the customer actually selected. A blank carrier at import time is not proof the customer chose DHL.

Archived components

ID 8 originally set DHL Germany; ID 65 set DHL International; both are now archived after testing the combined replacement. ID 7 Auto Set Carrier remains archived because it updated transfers to a fixed carrier.

Archived status of old international rule (ID 65) was confirmed by the Odoo screenshot dated 14 October 2026.

2. Outgoing transfer carrier synchronization

Automation 66 keeps the transfer carrier aligned with the linked sales order. This addresses the earlier case S00462 / WH1/OUT/06242: the sales order used DHL International while its delivery showed GLS Germany.

PROPERTY	VALUE
Model	Transfer (stock.picking)
Purpose	Copy the sales order carrier to outgoing warehouse delivery
Expected safeguard	Skip done/cancelled transfers; skip transfers with existing tracking
Preserve GLS	Never force DHL when the selected sales-order method is GLS
Staging URL	https://iq-dogsport-staging-38965432.dev.odoo.com/odoo/automations/66

Reference Python code — export final saved implementation

The earlier troubleshooting reference below illustrates the intended operation. The exact saved code was not supplied to this conversation. If Automation 66 differs from this reference, save its real code in the documentation before Production.

```
pickings = records or record or env['stock.picking']
for picking in pickings:
    if picking.picking_type_id.code != 'outgoing':
        continue
    if picking.state in ('done', 'cancel'):
        continue
    if picking.carrier_tracking_ref:
        continue
    so = picking.sale_id
    if not so or not so.carrier_id:
        continue
    if so.carrier_id.delivery_type != 'dhl_parcel_de':
        continue
    if picking.carrier_id.id != so.carrier_id.id:
        picking.write({'carrier_id': so.carrier_id.id})
        log('Carrier sync: %s -> %s' %
            (picking.name, so.carrier_id.name), level='info')
```

Read-only command to export IDs and code

```
for aid in [64, 66]:
    a = env['base.automation'].sudo().browse(aid)
    print(a.id, a.name, 'active:', a.active, 'trigger:', a.trigger)
    for action in a.action_server_ids:
        print('ACTION:', action.name, '|', action.state)
        if action.state == 'code':
            print(action.code)
# Also inspect the active combined sale.order automation by name/ID.
```

Staging test proof: Austria S00464 / WH1/OUT/06244 and Germany S00465 / WH1/OUT/06245 used the correct DHL products and generated sandbox labels on 13 October. The user also retested domestic and international sales orders successfully on 14 October.

3. German DHL Return Receiver ID

Automation 64 — DHL Automatic Return Receiver fills the receiver for German returns and deliberately leaves international receivers unassigned until staff select a valid country-specific receiver.

SETTING	VALUE / LOGIC
Model / Trigger	Transfer (stock.picking) / On create and edit
When updating	Carrier, Contact, Operation Type
Action	Execute Code
DE default	dhl_return_receiver_id = deu
Safety	Only incoming DHL return, before completion, when receiver ID is empty
International	Do not populate deu for returns originating outside Germany
Staging URL	https://iq-dogsport-staging-38965432.dev.odoo.com/odoo/automations/64?debug=1

Receiver automation code — documented implementation

This is the implementation from the earlier receiver automation documentation; compare it with the saved action when preparing a final Production copy.

```
pickings = records or record or env['stock.picking']
for picking in pickings:
    if not picking.is_dhl_return:
        continue
    if picking.picking_type_id.code != 'incoming':
        continue
    if picking.carrier_id.delivery_type != 'dhl_parcel_de':
        continue
    if picking.state in ('done', 'cancel'):
        continue
    if picking.dhl_return_receiver_id:
        continue
    if picking.partner_id.country_id.code == 'DE':
        picking.write({'dhl_return_receiver_id': 'deu'})
        log('DHL receiver deu assigned to %s' %
            picking.name, level='info')
```

Technical caveat: `is_dhl_return` is a computed/non-stored field. Keep it in Python, not in the automation search domain. The empty Receiver ID guard ensures manual receiver selections are not overwritten.

4. Receiver selection interface — view 6113

The inherited XML view is not an automated action. It controls visibility of the existing BrowseInfo receiver-wizard button and a newly added Change Receiver button.

VIEW PROPERTY	VALUE
View	IQ DHL – Conditional Receiver Buttons
Odoo view ID	6113 in Staging
Parent	stock.picking.form.inherit.dhl (ID 6081 in Staging)
Mode / Website	extension / none
Action method	action_open_return_receiver_wizard

XML behavior (conditions must stay on a single line)

```
<!-- Pseudocode: substitute the two conditions below -->
<xpath expr="//button[@name='action_open_return_receiver_wizard']"
       position="attributes">
  <attribute name="invisible">CONDITION_GET</attribute>
</xpath>
<!-- Add Change Receiver: method action_open_return_receiver_wizard;
     its 'invisible' value is CONDITION_CHANGE. -->
```

Complete condition for Get Receivers: `not is_dhl_return or state in ('done', 'cancel') or carrier_tracking_ref or dhl_return_receiver_id`

Complete condition for Change Receiver: `not is_dhl_return or state in ('done', 'cancel') or carrier_tracking_ref or not dhl_return_receiver_id`

Both buttons call BrowseInfo's existing receiver-selection wizard. After a label creates tracking, both selectors are hidden. To reproduce the view in Production, look up the parent by technical name; numeric IDs may differ.

Observed return behavior

ORIGIN	BEFORE LABEL	OBSERVED RESULT
Germany	deu auto-populated	Return label generated; manual override tested in separate return
International	No automatic Receiver ID	Wizard requires manual valid receiver selection; Staging return worked after selection

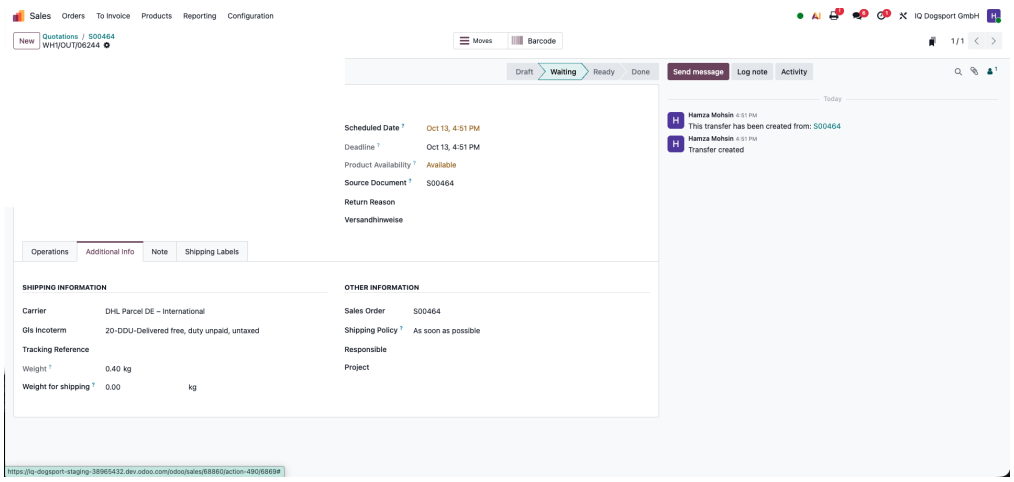

Staging test references: WH1/RET/00528 (German label), WH1/RET/00529 (deu to deu_ggp override). On 14 October, the user also verified a new DE return without manual receiver changes and an international return after manual receiver selection.

5. Shipping tests and verified outcomes

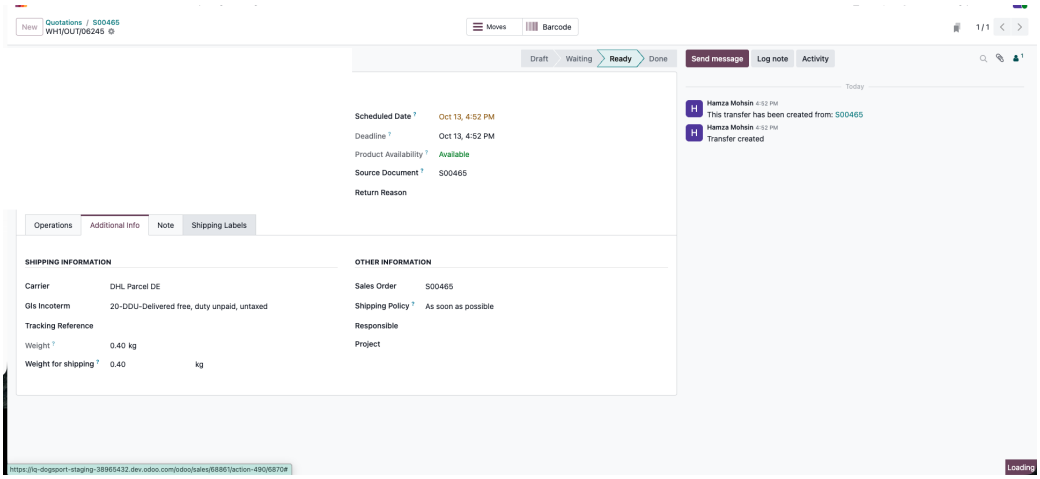

These observations are based on user-supplied Odoo screenshots and Staging confirmations. Sandbox labels stamped MUSTER are not valid live postage.

DATE / TEST	SALES / TRANSFER	OBSERVATION
13 Oct — Italy	S00456 / WH1/OUT/06236	DHL International label after selecting correct transfer carrier; V53WPAK
13 Oct — Austria	S00464 / WH1/OUT/06244	Transfer = DHL International; label generated automatically after test setup
13 Oct — Germany	S00465 / WH1/OUT/06245	Transfer = DHL Domestic; German DHL Paket sandbox label generated
14 Oct — Domestic + international	New test orders (IDs not provided)	Combined Sales Order automation + Transfer sync both working
14 Oct — Returns	German and international returns	German deu auto-filled; international receiver requested manually; both completed in Staging

Sample evidence: Domestic and international transfer carrier

Staging screenshot from Austria transfer test (name/address area hidden for documentation).

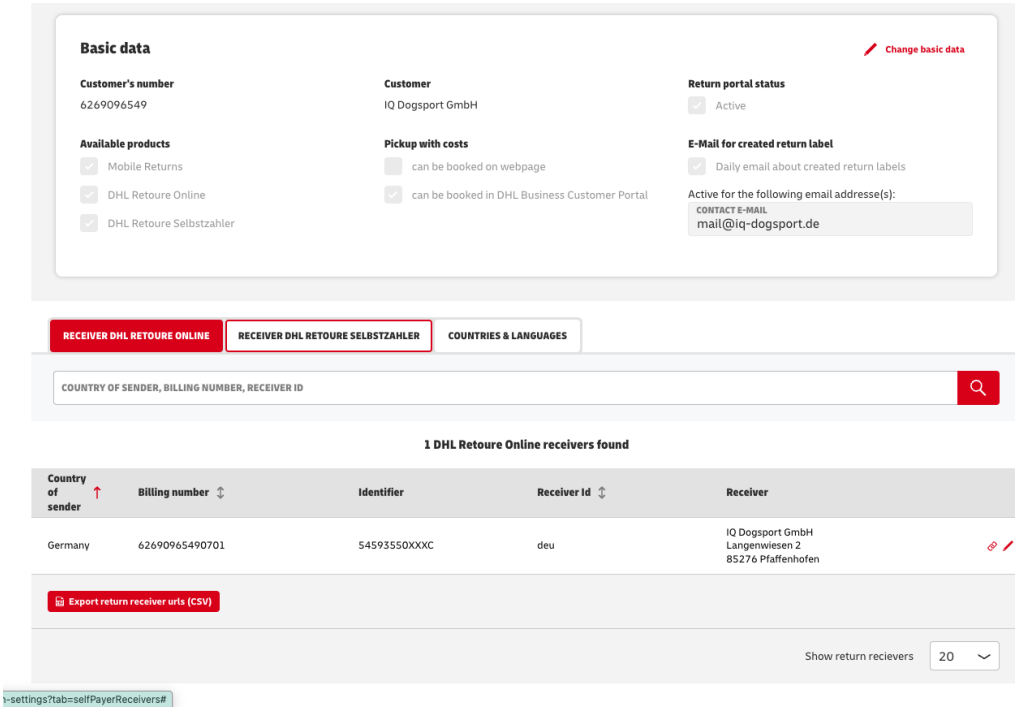

Staging screenshot from Germany transfer test (name/address area hidden for documentation).

6. DHL Business Customer Portal — actual receivers

The portal was checked on 14 October 2026. This distinguishes the German production-account receiver from sandbox test identifiers and from the separate customer-paid Selbstzahler service.

SERVICE	RECEIVER ID	COUNTRY / ADDRESS
DHL Retoure Online	deu	Germany, IQ Dogsport GmbH, Langenwiesen 2, 85276 Pfaffenhofen
DHL Retoure Selbstzahler	deu_SZ	Germany, same current Pfaffenhofen address; old Baar-Ebenhausen address corrected
International Retoure Online	Not listed	No separate Austria, Italy, France, etc. receivers shown in portal

DHL portal shows one Retoure Online receiver (Germany, deu) and one separate Selbstzahler receiver (Germany, deu_SZ). A CSV exported from Selbstzahler contained column headings only, not additional country receiver data.

DHL Business Customer Portal: Receiver DHL Retoure Online lists only Germany / deu (14 October 2026).

Commercial policy and unresolved business decision

IQ Dogsport policy: customers pay their return shipping costs. A company-generated prepaid DHL label may initially bill IQ Dogsport unless DHL supports a direct customer-pay workflow. Whether to offer international customer-paid return labels will be discussed with management later; do not treat this as an implemented functionality.

7. Production readiness and documentation checklist

Current tests prove Staging behavior, not live DHL permissions, customer charges or Shopify routing. Reproduce Staging changes in Production only after the following controls are reviewed.

- Record the new combined Sales Order automation ID and exact saved Python code; verify all three active rule settings and triggers.
- Export Automation 66 real Execute Code action (prior PDF only contained reference logic). Export Automation 64 final saved action too.
- Confirm 8 + 65 + 7 are archived, not deleted, and capture the rollback configuration.
- Test an imported Shopify order where the customer selected GLS; do not allow country defaults to replace it.
- Verify allowed delivery countries; “not DE” alone includes unsupported destinations and currently paused UK direct shipping.
- Review live DHL Shipping and Returns API credentials, billing numbers, carrier products and billing before generating real labels.
- Recreate both DHL carrier records (V01PAK / V53WPAK), the three approved automations, and UI View 6113 with proper live parent view.
- Confirm Retoure Online receiver deu still routes to Pfaffenhofen; only enable other countries after real receiver IDs/contracts are available.
- Run controlled DE, AT/IT, GLS, DE return and international-return tests; confirm who is actually billed for return postage.
