Carrier assignment: Germany → DHL, international → GLS (26.10.2026)

Status 26.10.2026: tested in Staging (`iq-dogsport-staging-40297587`), all tests passed. Not yet in Production. Decision by Florian (23.10.2026): Germany ships with DHL, international stays with GLS for now.

> Credentials, tokens and customer data are intentionally not stored here. IDs below are **Staging IDs** — Production IDs must be checked before the rollout (section 7).

1. Target behaviour

Situation	Delivery method on the order	Carrier on the delivery
Delivery address in Germany, no method set	DHL Parcel DE	DHL Parcel DE
Delivery address outside Germany, no method set	GLS Germany	GLS Germany (+ GLS incoterm)
Quotation: address changed Germany ↔ abroad	switches DHL ↔ GLS	follows the order
Method chosen by hand (e.g. Direct Sales)	kept, never overwritten	kept
Confirmed order	never changed by the rules	–

Principle: the *sales order* decides the carrier in one place; the delivery takes it over via the route option *Propagation of carrier* (already ticked on the delivery rules, no change).

2. What was wrong before

- The carrier was set in **four** places: rule *Shipping add* (order) and rules *Auto Set Incoterms – EFTA*, *– Outside EU* and *Auto Set Carrier* (delivery). The three delivery rules always wrote **GLS Germany**, so a DHL order still ended up with a GLS delivery.
- *Shipping add* used the condition `("carrier_id.name", "=", False)`. In Odoo 17+ a condition through a related field never matches an *empty* field, so the rule **never ran** (`last_run` empty). GLS on deliveries only came from the delivery rules.
- The rule ran only *on create*: changing the customer/address on a quotation afterwards kept the old carrier (test S00475: Swiss address with DHL).

3. Changes made in Staging

#	Automation rule (Staging ID)	Before	After
1	**Shipping add** (8) – Sales Order	Trigger *On create*; Apply on `[("carrier_id.name", "=", False)]`; action → DHL Parcel DE	Trigger *On create and edit*; When updating: *Delivery Address*; Apply on: see below; action unchanged → **DHL Parcel DE**
2	**Shipping add – International (GLS)** (43, new) – Sales Order	–	Duplicate of rule 8; Trigger *On create and edit*; When updating: *Delivery Address*; Apply on: see below; action → **GLS Germany**
3	**Auto Set Incoterms Based on Country Groups – EFTA** (5) – Transfer	2 actions: Carrier → GLS Germany, Gls Incoterm → 20	Carrier action **deleted**; Gls Incoterm → 20 kept
4	**Auto Set Incoterms Based on Country Groups – Outside EU** (6) – Transfer	2 actions: Carrier → GLS Germany, Gls Incoterm → 40	Carrier action **deleted**; Gls Incoterm → 40 kept
5	**Auto Set Carrier** (7) – Transfer	Active, sets Carrier → GLS Germany on create and every edit	**Archived** (not deleted)
–	Routes: rules *Pull From WH1/Stock → Customers* (1-step and 3-step)	*Propagation of carrier* already ticked – no change	

Apply on – Shipping add (DHL, Germany)

```
["&", "&", ("state", "in", ["draft", "sent"]), ("partner_shipping_id.country_id", "in", [57]), "|", ("carrier_id", "=", False), ("carrier_id", "=", 2)]
```

= Quotation or Quotation Sent · Delivery Address → Country = Germany · Delivery Method not set *or* GLS Germany.

Apply on – Shipping add – International (GLS)

```
["&", "&", ("state", "in", ["draft", "sent"]), ("partner_shipping_id.country_id", "not in", [57]), "|", ("carrier_id", "=", False), ("carrier_id", "=", 25)]
```

= Quotation or Quotation Sent · Country ≠ Germany · Delivery Method not set *or* DHL Parcel DE.

Staging IDs: country Germany = `57`, GLS Germany = `2`, DHL Parcel DE = `25`. **When updating** must contain only *Delivery Address* (not *Delivery Method*), otherwise a manual GLS choice on

a German quotation would be switched back.

4. Tests in Staging (26.10.2026)

4.1 Orders created in Odoo

Test	Order → delivery	Result
German address	S00476 → WH1/OUT/06865	**DHL Parcel DE ✓**
Swiss address	S00477 → WH1/OUT/06866	**GLS Germany ✓**
Quotation address Germany → Switzerland	S00479 → WH1/OUT/06868	**switched to GLS ✓**
Quotation address Switzerland → Germany	S00480 → WH1/OUT/06869	**switched to DHL ✓**
Direct Sales chosen by hand	S00481 → WH1/OUT/06870	**Direct Sales kept ✓**
Direct Sales, then address Germany → Switzerland	S00482 → WH1/OUT/06871	**Direct Sales kept ✓**

4.2 Orders from the Shopify test store (iq-dogsport-test)

Test	Order → delivery	Result
German address, imported via webhook	#IQD-POS-1127 → WH1/OUT/06873	**DHL Parcel DE ✓ (delivery Ready, no label created)**
International address, online-store checkout with shipping rate	#IQD-POS-1130 → WH1/OUT/06874	**GLS Germany ✓ (GIs Incoterm set)**

Before the first failed test, an earlier delivery (S00471–S00473) showed an empty carrier: archiving *Auto Set Carrier* alone is not enough while *Shipping add* has the broken condition – both changes belong together.

5. Test-store setup in Staging (for reference)

- Staging is a copy of Production, including the **live** Shopify instance. It stays **archived** in Staging. **Never archive or sync it** (see the incident page of 23.10.2026).
- New instance **IQ Dogsport TEST** (host `iq-dogsport-test.myshopify.com`) created via *Create New Store* with a custom app *Odoo Staging Connector* in the test store (Admin API scopes for orders, products, inventory, locations, customers, fulfillments, fulfillment orders, shipping).
- Location *Shop location* imported → IQ Dogsport Main Warehouse. Webhook *Order Update* added on the instance (Webhooks tab → Add a line). Schedulers not activated.

- Financial Status lines for TEST: *manual* and *bogus* + paid + Unshipped → *Automatic Validation for Manual Payment*, Immediate Payment.
- **Emipro bug found:** with *Use GraphQL API* on, orders without Shopify risk analysis (draft/admin orders, test-mode payments – "Order risk: Analysis not available") fail with `order_risk.py` line 67 `AttributeError: 'list' object has no attribute 'get'`. Workaround on the TEST instance only: GraphQL unticked. Reported/to report to Emipro – it can also affect manually created orders in Production.

6. Production rollout – checklist

1. **Shopify (live store):** rename the German rate "GLS Deutschland" → "DHL Paket" (prices unchanged unless Florian decides otherwise), keep international GLS rates; update shipping page, policy and notifications ("DHL in Germany, GLS international"). Check the Odoo method linked under *Shopify Carrier Info* still only adds the price line.
2. **Backup** Production on Odoo.sh.
3. **Check Production IDs** (read-only, section 7): Germany, GLS Germany, DHL Parcel DE, and the automation rules. Replace 57 / 2 / 25 in the domains if different.
4. Change **Shipping add** as in section 3 (trigger, When updating, Apply on). Save.
5. **Duplicate** it → *Shipping add – International (GLS)*, action → GLS Germany, Apply on as in section 3. Save.
6. Delete the **Carrier → GLS Germany** action in both *Auto Set Incoterms* rules (keep the incoterm action).
7. **Archive** *Auto Set Carrier* (last step, so deliveries are never without a carrier in between).
8. Check the route rules have *Propagation of carrier* ticked (expected, no change).
9. **Verify** the first real orders: one German (order + delivery = DHL Parcel DE), one international (GLS Germany). Run the check query in section 7. Open GLS deliveries created before the switch stay as they are.
10. Labels: DHL methods use 103×199 (910-300-610) until the 103×150 rolls (910-300-410) are in use; then change Label Type on both DHL carriers.
11. Do **not** touch *Use GraphQL API* on the live instance; wait for Emipro's fix.

Rollback

- Shipping add: trigger *On create*, Apply on `[("carrier_id.name", "=", False)]`, When updating empty.
- Shipping add – International (GLS): archive.
- Auto Set Incoterms (both): Add an action → Update Record → Carrier → GLS Germany.
- Auto Set Carrier: Automation Rules → filter Archived → Unarchive.

7. Read-only checks (Odoo.sh → SHELL)

IDs of Germany and the carriers

```
PGOPTIONS='-c default_transaction_read_only=on' psql -P pager=off -c "SELECT 'country' AS what, id, code AS name FROM res_country WHERE code='DE' UNION ALL SELECT 'carrier', id, to_jsonb(c)->>'name' FROM delivery_carrier c WHERE active ORDER BY 1, 2;"
```

Automation rules on orders and deliveries

```
PGOPTIONS='-c default_transaction_read_only=on' psql -P pager=off -c "SELECT a.id, to_jsonb(a)->>'name' AS name, a.active, a.trigger, m.model, to_jsonb(a)->>'filter_domain' AS apply_on, a.last_run FROM base_automation a JOIN ir_model m ON m.id = a.model_id WHERE m.model IN ('sale.order','stock.picking') ORDER BY m.model, a.id;"
```

Which field each rule action writes

```
PGOPTIONS='-c default_transaction_read_only=on' psql -P pager=off -c "SELECT s.base_automation_id AS rule, f.model, f.name AS field, s.value FROM ir_act_server s LEFT JOIN ir_model_fields f ON f.id = (to_jsonb(s)->>'update_field_id')::int WHERE s.state = 'object_write' AND s.base_automation_id IS NOT NULL ORDER BY 1;"
```

Check the newest orders after go-live

```
PGOPTIONS='-c default_transaction_read_only=on' psql -P pager=off -c "SELECT so.name, so.carrier_id, c.code AS ship_country, sp.name AS delivery, sp.carrier_id AS delivery_carrier FROM sale_order so LEFT JOIN res_partner p ON p.id = so.partner_shipping_id LEFT JOIN res_country c ON c.id = p.country_id LEFT JOIN stock_picking sp ON sp.sale_id = so.id ORDER BY so.id DESC LIMIT 10;"
```

Expected: `DE` → DHL Parcel DE on order and delivery; other countries → GLS Germany.

8. Open items

- Emipro: fix the GraphQL order-risk crash (section 5).
- Florian: return costs, international DHL returns, DHL customer prices per zone, customs data for non-EU.
- Later: if DHL becomes cheaper for some countries, only the two *Shipping add* rules need a country list – the delivery rules don't set carriers any more.
- Security: rotate credentials that were visible in screenshots (DHL portal password/client secret, Shopify app secret keys).
